# Assignment 13

## Sairam V C Rebbapragada

Abstract—This document uses the concepts of matrix trace, eigen values, minimal polynomial etc in solving a problem.

#### 1 Problem

Let  $M_n(\mathbb{R})$  be the ring of  $n \times n$  matrices over  $\mathbb{R}$ . Which of the following are true for every  $n \ge 2$ ?

- 1) there exists matrices A, B  $\in M_n(\mathbb{R})$  such that  $AB BA = I_n$ , where  $I_n$  denotes the identity  $n \times n$  matrix.
- 2) if A, B  $\in M_n(\mathbb{R})$  and AB = BA, then A is diagonalizable over  $\mathbb{R}$  if and only if B is diagonalizable over  $\mathbb{R}$ .
- 3) if A, B  $\in M_n(\mathbb{R})$ , then AB and BA have same minimal polynomial.
- 4) if A, B  $\in$   $M_n(\mathbb{R})$ , then AB and BA have same eigenvalues in  $\mathbb{R}$ .

### 2 Explanation

If A, B are two matrices of same size and k is any scalar, then we know that

$$trace(A + B) = trace(A) + trace(B)$$
 (2.0.1)

$$trace(kA) = k \times trace(A)$$
 (2.0.2)

$$trace(AB) = trace(BA)$$
 (2.0.3)

#### 3 Solution

1) Consider option 1 is true. It means that there exists matrices A, B such that  $AB - BA = I_n$ .

$$\implies tr(AB - BA) = tr(I_n)$$
 (3.0.1)

$$\implies tr(AB) - tr(BA) = n$$
 (3.0.2)

$$\implies 0 = n \tag{3.0.3}$$

But it is given that  $n \ge 2$ . This contradicts our assumption. Hence, option 1 is FALSE.

2) Let A be a zero matrix of order n and B be any non-diagonalizable matrix of order n. We know that a zero matrix is always diagonalizable.

As, 
$$A = 0_{n \times n}$$

$$AB = 0 = BA \tag{3.0.4}$$

We can observe here that when AB = BA, matrix A is diagonalizable even though matrix B is not diagonalizable. Hence, option 2 is FALSE.

3) The minimal polynomial m(x), of a matrix A, is the polynomial P of minimum degree such that P(A) = 0.

Let 
$$A = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$$
 and  $B = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$  (3.0.5)

$$\implies AB = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} \text{ and } BA = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$$
 (3.0.6)

We can observe here that

$$m_{BA}(x) = x \text{ while} ag{3.0.7}$$

$$m_{AB}(x) = x^2 (3.0.8)$$

As minimal polynomial of AB and BA are not same, option 3 is also FALSE.

4) Let  $\lambda$  be an eigen value of AB, it implies that there is some  $x \neq 0$  such that,

$$ABx = \lambda x \tag{3.0.9}$$

Let y = Bx. Then  $y \ne 0$ . Otherwise we would get from (3.0.9) that  $\lambda = 0$  or x = 0. Now we have,

$$BAy = BABx = B(ABx)$$
$$= B(\lambda x) = \lambda Bx = \lambda y$$

It follows that  $\lambda$  is an eigen value of BA. Hence, option 4 is TRUE.
